

Alberto Andeliero

Software Engineer

I build backend systems for connected devices at scale: event driven ingestion from equipment in the field, the public APIs on top of it, and the AWS and Kubernetes infrastructure underneath. I am used to owning a service from product requirements through to production and on call.

EXPERIENCE

Software Engineer

2021 – Present

Lunatech, The Netherlands

Connected vehicle data platform for Audi: telemetry and vehicle data arriving from cars in the field, processed by non blocking reactive microservices on AWS, and exposed to internal teams and third party consumers through public APIs. I also maintain the shared library the team's services are built on.

- Built the event driven ingestion and processing services on Kafka, with Cassandra schemas designed around write throughput and data integrity.
- Designed and shipped an API management layer with sandbox and commercial tiers, cost calculation for business plans, OAuth2 and JWT through ForgeRock, and OpenAPI documentation generated from the Scala sources.
- Built a GDPR consent engine governing what each driver's data may be used for, enforced across every downstream consumer of the platform.
- Ran the platform on AWS and Kubernetes: Helm and Kustomize for cluster configuration, Terraform and OpenTofu for infrastructure, and CI/CD pipelines covering build, test and deployment.
- Instrumented the platform end to end with Jaeger tracing, Prometheus and Grafana metrics and Kibana logs, so a failing service could be isolated quickly during an incident.

Stack: Scala, Java, Rust, Kafka, Cassandra, PostgreSQL, Akka and Pekko, AWS, Kubernetes, Docker, Helm, Kustomize, Terraform, OpenTofu, Prometheus, Grafana, Jaeger.

Java Developer, Consultant

2017 – 2021

H-Farm S.p.A., Italy

Consultant embedded in the R&D unit of a multinational fintech client, on a product line shipped to banking customers, plus a second engagement for a small enterprise customer.

- Turned product requirements into use cases and working software for the financial product catalogue and financial position portfolio modules, inside an OSGi codebase where backward compatibility across released versions was a hard constraint.
- Worked with RabbitMQ for asynchronous messaging between services.
- Built and maintained a license management portal for an enterprise customer, from the Spring Framework baseline through to the React front end and the schema migrations behind it.

Stack: Java, OSGi, bnd, RabbitMQ, WebSphere, Tomcat, EclipseLink, Hibernate, Spring, Liquibase, PostgreSQL, Oracle Database, Jenkins, TypeScript, React.

Backend Developer

2016 – 2017

Nextep S.r.l., Italy

First professional role, on a small team building and maintaining backend services.

- Developed and maintained backend applications in Scala and Java on Play Framework and Spring, backed by MongoDB.

Stack: Scala, Play Framework, Java, Spring, MongoDB.

SKILLS

Languages

Java, Scala, TypeScript, SQL, Rust

Backend and APIs

REST and OpenAPI, Akka and Pekko, Spring, Play Framework, JPA and Hibernate, OAuth2 and JWT

Messaging

Kafka, RabbitMQ

Data

PostgreSQL, Oracle Database, Cassandra, MongoDB, Liquibase

Cloud and platform

AWS, Docker, Kubernetes, Helm, Kustomize, Terraform, OpenTofu, GitHub Actions

Observability

Prometheus, Grafana, Jaeger, Kibana

EDUCATION

BSc in Computer Science

2011 – 2016

University of Padua

LANGUAGES

Italian (native)

English (professional)
